

VKU Field Survey

Offline Data Collection PWA and Capacitor

A local-first campus facility inspection system for classrooms, laboratories, basements and remote buildings with weak or unavailable connectivity.

1. Problem And Objective

A network-dependent inspection form can lose unfinished observations, photos and submissions. This project treats IndexedDB as the primary source of truth: it autosaves drafts, accepts submissions offline, survives refresh/restart and synchronizes queued UUID records when the API is reachable.

The professional extension adds inspector/session accountability, category checklists, issue classification, GPS evidence, dashboard metrics, detailed history and offline export while preserving the original PWA and sync requirements.

2. Feature Checklist

DONE	Standalone manifest, VKU theme, 192/512 icons and app-shell precache
DONE	IndexedDB autosave, draft restore and schema-v1 compatibility
DONE	Local profile, active session and immutable survey snapshots
DONE	Six-step form, custom room, room type and 1-5 star rating
DONE	Five category-specific checklists with OK/Issue/Not Checked
DONE	Severity, priority, issue type, recommended action and evidence rules
DONE	Photo/GPS evidence with web and Capacitor implementations
DONE	Sequential offline queue, reconnect sync and idempotent UUID API
DONE	Filters, Needs Action badge, dashboard and local CSV/JSON export
PENDING	Final APK build/install and physical-device verification
PENDING	Public HTTPS deployment URL

Architecture And Offline Flow

3. Architecture

React UI (shared PWA / Android code)

- > IndexedDB v2: surveys | profile | sessions
- > local-first submit: DRAFT -> PENDING_SYNC
- > foreground sync / Background Sync (sequential)
- > Express REST API
- > JSON storage (idempotent survey UUID) -> SYNCED

Client

React, TypeScript, Vite, Tailwind, React Router, `idb`, Workbox and Capacitor.

Server

Node.js, Express, nested payload validation and queued atomic JSON writes.

4. Data Model

Each Survey includes UUID/timestamps, sync status, inspector snapshot, session snapshot, facility location, room type, category checklist, rating, severity, priority, issue type, recommended action, notes, optional Base64 photo and GPS status/evidence.

Snapshots preserve historical accountability when the local profile or active session changes. IndexedDB version 2 adds `profile` and `sessions`; a runtime normalizer safely reads original version-1 survey records.

5. Reliability Rules

- Draft changes are debounced and stored locally.
- Submission persists locally before any API request.
- Only a confirmed response changes status to Synced.
- Failures retain all data and remain retryable.
- A lock prevents overlapping foreground sync runs.
- Queued records upload in creation order; repeated UUIDs do not duplicate server data.
- Startup, browser/native network events and manual retry back up Background Sync.

6. PWA And Native Bridge

Workbox precaches HTML, CSS, JavaScript, icons and manifest data for offline boot. Browser evidence uses file input and Web Geolocation; Android uses Capacitor Camera, Network and Geolocation. GPS failure is recorded as unavailable and does not block a valid survey.

Offline inspector identity

Six-step inspection review and validation

Professional filters, sync and local export

Screenshots are generated by the repeatable Chromium E2E workflow at a 390 x 844 mobile viewport.

Results

7. Automated Verification

Unit / Integration

Business rules, High/Critical photo requirement, old-schema normalization, IndexedDB profile/session persistence, immutable snapshots, queue ordering and server validation.

Browser E2E

Profile refresh, online submit, offline Pending Sync, reconnect auto-sync, GPS capture, CSV download and service-worker offline boot.

8. Delivery Status

The source code, screenshots and this 4-page report are ready locally. The web/PWA flow is stable and tested before APK work, following the required implementation order. Remaining external tasks are publishing the HTTPS PWA/public repository and building/installing the APK in an Android SDK device or emulator environment.

9. Conclusion

VKU Field Survey meets the original offline-first learning objectives and now models a credible campus inspection process. Its core guarantee remains unchanged: valid field data is saved locally first and never depends on immediate connectivity.
